evolv Data Loader

Streamline and automate master data management

> **We were able to significantly reduce the time needed for managing data in OTM thanks to possibility to upload bulk data in a controlled way**

– Krzysztof Majdanski, Product Owner, Volvo

evolv Data Loader enables your business users to create, maintain and load OTM data without needing IT resources. Pre-defined data templates, mapped to OTM data objects work to ensure accuracy and consistency.

These templates can be populated offline with multiple parties involved in editing and maintenance. evolv restructures the data and validates it automatically providing human-readable error logs. Run or schedule data uploads from evolv to your OTM solution.

evolv Data Loader

Key features of evolv Data Loader include:

- Upload or directly integrate master data into OTM
- Mass upload of transactional data such as orders or shipments, using custom, specialised Excel templates for ease of use
- Easy creation of templates from scratch
- Automated data validation, transformation & structuring
- Readable error reports and logging
- Version control critical master data

Key benefits of evolv Data Loader include:

- Efficient, saves time and resource
- Accelerates data loading for faster deployments/onboarding
- Improves data quality for better system performance
- Maintain data offline for easier editing
- Empowers business users to maintain data without IT

"The evolv Data Loader application has automated and simplified our OTM transportation data management processes. Without this tool, we would never be able to manage the significant amount of OTM transportation data for our service provider rates, accessorial rates, planning costs, driver costs, equipment costs, railroad schedules, and itinerary routes."

Jim Brewster, Solutions Architect, Schneider National, Inc.

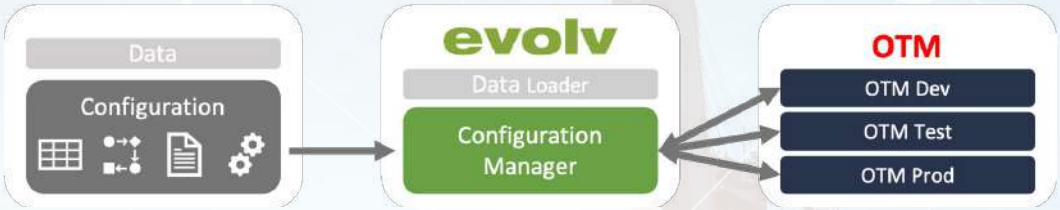
evolv Configuration Manager

Simplify and control configuration management

evolv Configuration Manager offers advanced features to simplify release management (export and import). Providing a central repository for you to track and manage configuration and data changes across environments, domains, teams and business units.



Key features of the Configuration Manager include:

- Transfer data, manage configuration and releases across multiple OTM environments
- Validate objects, test status and sequence files for deployment
- Take configuration snapshots for support or backup purposes
- Works with non OTM configuration such as file system objects

Key benefits of the Configuration Manager include:

- Reduce time to promote changes
- Better control with best-practice release management
- Remove manual transcription errors
- Ensure all configuration is moved to target environments
- Improve auditing, traceability and change management
